Mid-Atlantic - Warm Season Grass CALENDAR

SPREAD FERTILIZER •

Fertilizing is critical to keeping your lawn green, thick and healthy.

Apply one of Central Sod's turf fertilizers to keep your lawn well fed.

WEED CONTROL*

Broadleaf weeds like clover and dandelions might show up in May. This is a good time of year to spray them with a selective herbicide that will not harm your grass.

*only if needed / weeds present

WATERING •

Warm season grasses only require water in the event of a severe drought.

Watering once a week should be sufficient to keep the grass green.

APPLY FUNGICIDE*●

When nights are above 70 degrees and humid, we recommend applying a liquid fungicide once a month to protect your lawn from brown patch. Brown patch is an airborn fungus that attacks turferass.

*only needed if nights are consistently hot and humid look for patchy brown areas

MOWING •

Mow warm season grasses to a height of 1" to 2.5" inches as needed. Make sure to sharpen mower blades.

We recommend not bagging your clippings unless they start to clump, in which case they need to be bagged or raked

WHEN TO TEST YOUR SOIL

- New Lawns: Test after grading, but before seeding.
- Vegetable Gardens: Test every 3 years.
- Established Lawns & Garden Beds: Every 3-4 years.
- It's best to test in the fall.
